

MULTI-RESISTANT  
BCA 1

# AYACARA OILSEED RADISH

AYACARA is a late-flowering oilseed radish, with resistance to beet cyst nematodes (BCA 1, >90% nematode reduction) and resistance to *Meloidogyne chitwoodii/fallax*. It has a strong biomass development and is characterized by rapid soil coverage, which is beneficial for effective weed suppression.

With sufficient nitrogen availability in the soil, it can yield high dry matter outputs. When sown in early August under good growing conditions, the crop adds 1600 kg of effective organic matter to the soil.

Biomass production at the start

7 (High biomass)

Lateness of  
flowering

4 (late)

## CULTIVATION ADVICE

Sowing time

July - begin september (depending on location)

Seed quantity

25-30 kg per hectare

Fertilization

30-50 kg N per hectare

Oilseed radish  
*Raphanus sativus*
