

OILSEED RADISH

CORDOBA is a late-flowering oilseed radish recommended by the CSAR institute, with resistance against beet cyst nematodes (BCA 1, >90% nematode reduction) and resistance to *Meloidogyne chitwoodilfallax*. It has a strong biomass development and is characterized by rapid soil coverage, which is beneficial for effective weed suppression.

With sufficient nitrogen availability in the soil, it can yield high dry matter outputs. When sown in early August under good growing conditions, the crop adds 1600 kg of effective organic matter to the soil.

Ground cover speed	Lateness of flowering	Length (relative, 100 = 97 cm)	Extent of tuber development	Resistance to Alternaria	Regrowth after late mowing
 7,5 (rapid)	8 (late)	135	8	7,5	6
				Sc	ource: CSAR list 2025

CULTIVATION ADVICE

Sowing time	July - begin september (depending on	location)	
Seed quantity	25-30 kg per hectare		
Fertilization	30-50 kg N per hectare		Oilseed radish
VANDINTER SEMO			Raphanus sativus

Q

Stationsstraat 124, 9679 EG Scheemda - NL
