

MULTI-RESISTANT  
BCA 2

# VALENCIA OILSEED RADISH

VALENCIA is a late-flowering oilseed radish recommended by the CSAR, with broad resistance against beet cyst nematodes (BCA 2, 70-90% nematode reduction) and to *Meloidogyne chitwoodii/fallax*. It has a strong biomass development and rapid soil coverage, which is beneficial for effective weed suppression.

Oilseed radish can yield high dry matter outputs when there is sufficient nitrogen availability in the soil. When sown in early August, under good growing conditions, the crop adds 1600 kg of effective organic matter to the soil.

Ground cover speed	Lateness of flowering	Length (relative, 100 = 97 cm)	Extent of tuber development	Resistance to Alternaria	Regrowth after late mowing
7,5 (rapid)	8 (late)	135	8	7,5	6

## CULTIVATION ADVICE

Sowing time	July - begin september (depending on location)
Seed quantity	25-30 kg per hectare
Fertilization	30-50 kg N per hectare
